

Discrete trait models

Correlation of traits

Correlating two discrete traits

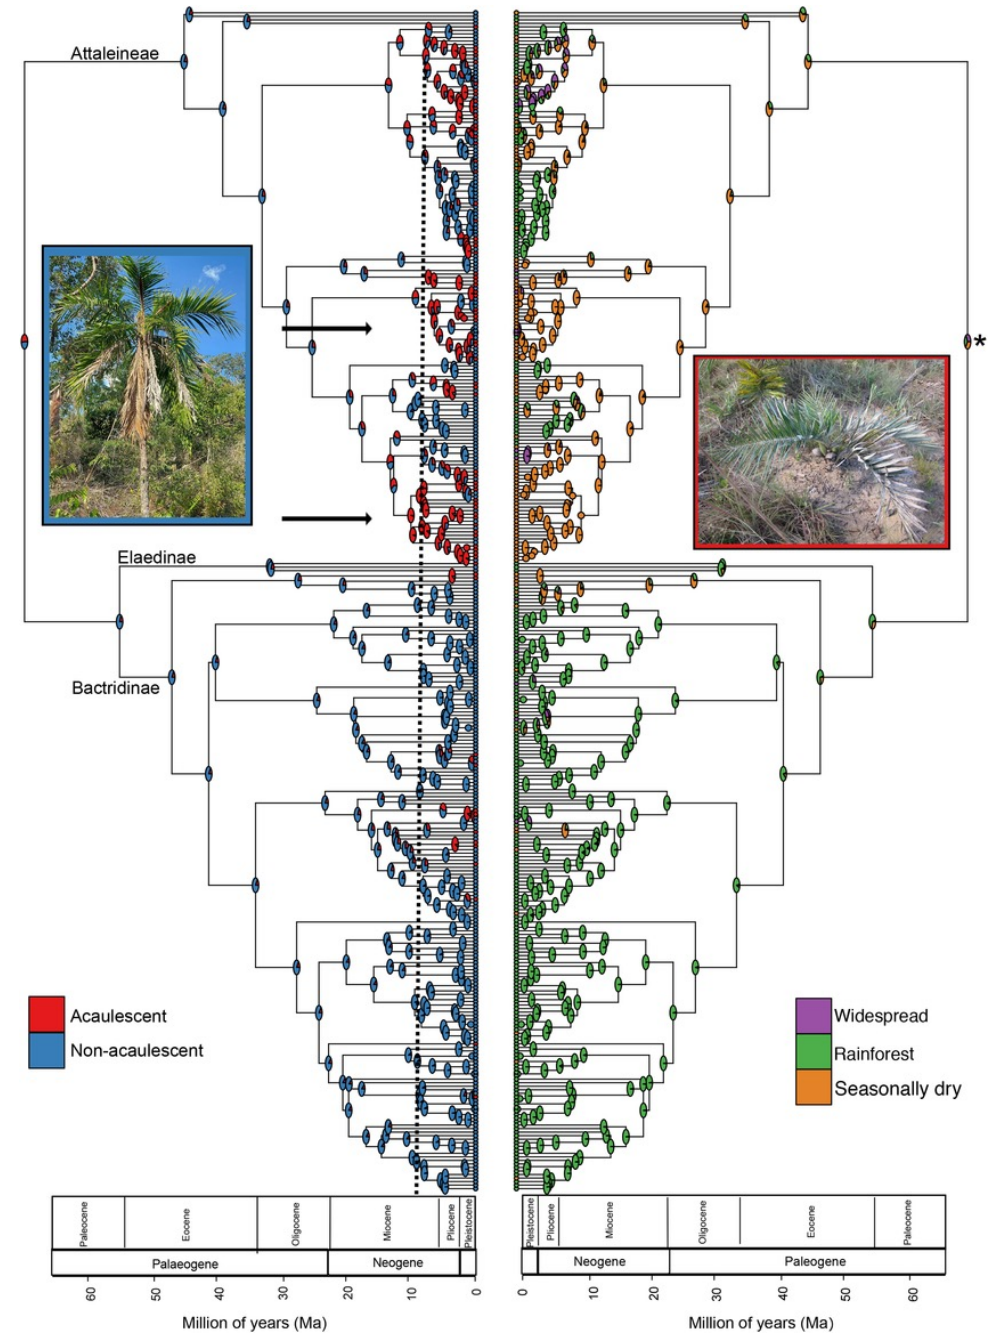

Mark Pagel -1994

Two traits

Acaulescent: X_1

Water Availability: X_2

Acaulescent: No visible above-ground stem

Correlated model

Uncorrelated model

Comparing nested models

- Likelihood Ratio Test
- Null hypothesis:
- Test statistic: $LRT = -2 \times \log\left(\frac{\text{Likelihood (Uncorrelated model)}}{\text{Likelihood (Correlated model)}}\right)$
- $LTR \sim \chi^2$ with degrees of freedom $k = \text{\#parameters full model} - \text{\#parameters reduced model}$
